Since many of today's systems are electronically controlled, the demand for trained technicians is greater than ever. Employers want employees who can understand a system and troubleshoot a problem logically. Diagnosis and repair of heavy trucks, industrial and agricultural machinery, transit, marine, and generator power sets are a few of the career pathways program graduates can take upon completion of the program.

Skagit Valley College's Diesel Power Technology (DSL) program is designed to prepare students for employment in this exciting and growing field.
